

Design Example Report

Title	<i>TRIAC Dimmable, Power Factor Corrected, 7.2 W Non-Isolated LED Driver Using LinkSwitch™-PL LNK460VG</i>
Specification	185 VAC – 265 VAC Input; 36 V _{TYP} , 200 mA Output
Application	A19 LED Driver
Author	Application Engineering Department
Document Number	DER-302
Date	January 11, 2012
Revision	1.0

Summary and Features

- Single-stage power factor correction combined with constant current (CC) output
- TRIAC Dimmable
 - Flicker free operation with a wide selection of TRIAC dimmers with ratings from 300 W to 1200 W
 - Provides output current even at very low conduction angles (no dead band)
- Low cost, low component count, small size and single-sided PCB
- High efficiency, >87% at 230 VAC input for 36 V LED Load
- Fast start-up time (<300 ms) – no perceptible delay
- Integrated protection and reliability features
 - Single shot no-load protection / output short-circuit protected with auto-recovery
 - Auto-recovering thermal shutdown with large hysteresis protects both components and PCB
 - No damage during brown-out conditions
 - No aluminum electrolytic bulk capacitor
- PF >0.9 at 230 VAC
- % ATHD <25% at 230 VAC; 36 V LED load
- Meets IEC ring wave, differential line surge and EN55015 conducted EMI

PATENT INFORMATION

The products and applications illustrated herein (including transformer construction and circuits external to the products) may be covered by one or more U.S. and foreign patents, or potentially by pending U.S. and foreign patent applications assigned to Power Integrations. A complete list of Power Integrations' patents may be found at www.powerint.com. Power Integrations grants its customers a license under certain patent rights as set forth at <http://www.powerint.com/ip.htm>.

Important Note: Although this board is designed to satisfy safety isolation requirements, the engineering prototype has not been agency approved. Therefore, all testing should be performed using an isolation transformer to provide the AC input to the prototype board.

1 Introduction

The document describes a non-isolated, high-efficiency, high power factor (PF), TRIAC dimmable LED driver designed to drive a nominal LED string voltage of 36 V at 200 mA from an input voltage range of 185 VAC to 265 VAC (47 Hz – 65 Hz). The LED driver utilizes the LNK460VG from the LinkSwitch-PL family of ICs.

The topology used is a single-stage non-isolated buck that meets the stringent space and efficiency requirements for this design.

LinkSwitch-PL based designs provide a high power factor (>0.9) meeting international requirements.

This document contains the LED driver specification, schematic, PCB details, bill of materials, transformer documentation and typical performance characteristics.

2 Power Supply Specification

The table below represents the minimum acceptable performance of the design. Actual performance is listed in the results section.

Description	Symbol	Min	Typ	Max	Units	Comment
Input Voltage Frequency	V_{IN} f_{LINE}	185	230 50	265	VAC Hz	2 Wire – no P.E.
Output Output Voltage Output Current Total Output Power Continuous Output Power	V_{OUT} I_{OUT} P_{OUT}		36 200 7.2		V mA W	$V_{OUT} = 36\text{ V}$, $V_{IN} = 230\text{ VAC}$, $25\text{ }^{\circ}\text{C}$
Efficiency Full Load	η	87			%	Measured at $P_{OUT} 25\text{ }^{\circ}\text{C}$
Environmental Conducted EMI Safety Ring Wave (100 kHz) Differential Mode (L1-L2) Common mode (L1/L2-PE) Differential Surge						
			CISPR 15B / EN55015B Non-Isolated			
			2.5		kV	
			500		V	1 kV with Relocation of MOV
Power Factor			0.9			Measured at $V_{OUT(TYP)}$, $I_{OUT(TYP)}$ and 230 VAC, 50 Hz
Harmonic Currents		EN 61000-3-2 Class D (C)				Class C specifies Class D Limits when $P_{IN} < 25\text{ W}$
Ambient Temperature	T_{AMB}		50		$^{\circ}\text{C}$	Free convection, sea level

3 Schematic

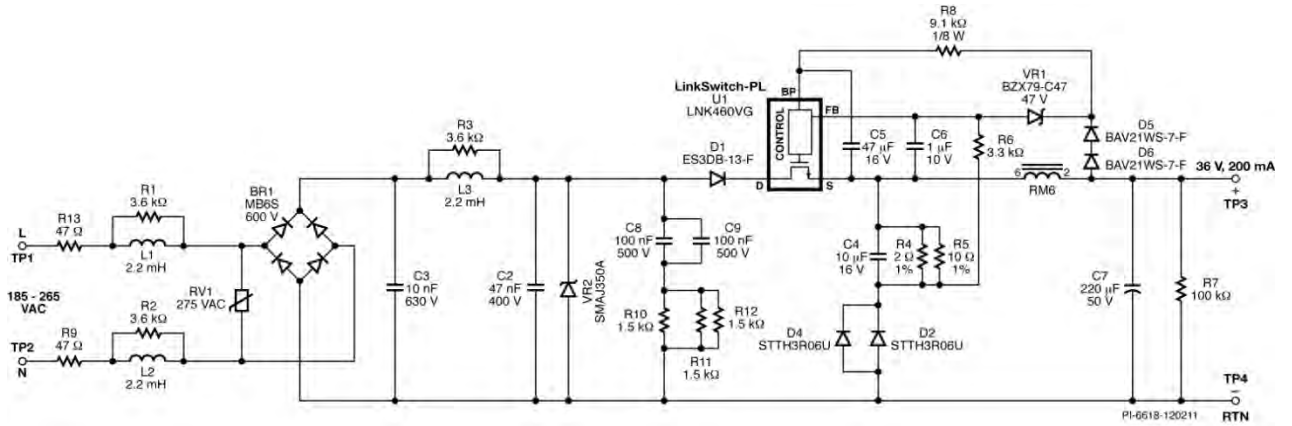

Figure 4 – Schematic.

4 Circuit Description

The LinkSwitch-PL (U1) is a highly integrated primary-side controller intended for use in LED driver applications. The LinkSwitch-PL provides high power factor while regulating the output current across a range of input (185 VAC to 265 VAC) in a single conversion stage. The design also supports the output voltage variations typically encountered in LED driver applications. All of the control circuitry responsible for these functions plus the high-voltage power MOSFET is incorporated into the IC.

4.1 Input EMI Filtering

Resistor R9 and R13 are fusible resistors that also serve as passive dampers to reduce input ringing during operation with a dimmer. MOV RV1 provides a clamp to limit the maximum voltage during differential line surge events. A 275 VAC rated part was selected, being slightly above the maximum specified operating voltage of 265 VAC. Zener diode VR2 was added to increase immunity to differential line surges. Bridge Rectifier BR1 rectifies the AC line voltage with capacitor C2 providing a low impedance path (decoupling) for the primary switching current. A low value of capacitance (sum of C2 and C3) is necessary to maintain a power factor of greater than 0.9.

EMI filtering is provided by inductors L1, L2 and L3, and capacitors C2 and C3. Resistor R1, R2 and R3 across L1, L2 and L3 damp any resonances between the input inductors, capacitors and the AC line impedance which would ordinarily show up on the conducted EMI measurements.

4.2 Power Circuit

The circuit is configured as a buck converter with the SOURCE (S) pin of U1 connected to the freewheeling diodes (D2 and D4) and Inductor T1. The DRAIN (D) pin is connected to the positive side of the DC rectified input via D1. Diode D1 is used to prevent reverse current from flowing through U1. An RM6 core size was selected to optimize the inductor for highest system efficiency. Capacitor C7 was selected to give an output LED ripple current of $\pm 50\%$.

Capacitor C5 provides local decoupling for the BYPASS (BP) pin of U1 which is the supply pin for the internal controller. During start-up, C5 is charged to ~ 6 V from an internal high-voltage current source connected to the DRAIN pin. Once charged U1 starts switching at which point the operating supply current is also provided from the output via R8 and series rectifier D5 and D6. Capacitor C5 was selected with a value of 47 μF to enable the IC to maintain operation during deep dimming where both drain supply and inductor current is not present (TRIAC not conducting) for much of each AC half-cycle.

The series combination of D5 and D6 was used to provide very fast recovery and low capacitance. This was required to minimize the current pulled out of the FB pin when charging the reverse capacitance of D5 and D6 when U1 turns on each switching cycle.

4.3 Output Feedback

Resistor R4 and R5 are used to sense the diode current of the buck converter. Its value is adjusted to center the output current at 200 mA at nominal input voltage. Capacitor C4 helps improve overall efficiency by allowing the high-frequency component of D2 and D4 current to bypass the current sensing resistors R4 and R5 which results in lower RMS dissipation on the current sensing network. Resistor R6 and C6 provide additional filtering to lower the ripple voltage fed to the FEEDBACK (FB) pin of U1 for improved regulation.

4.4 Open Load Protection

The LED driver is protected in the event of accidental open load operation by monitoring the voltage across the output inductor during energy decay. Zener diode VR1 sets the OVP threshold which forces U1 to enter cycle-skipping mode by exceeding the $I_{FB(SKIP)}$ threshold of the FEEDBACK pin. Resistor R7 is used to discharge any leakage current that charges the output capacitor C7 when U1 is off, and ensure the LEDs extinguish quickly when AC is removed.

4.5 TRIAC Phase Dimming Control Compatibility

The requirement to provide output dimming with low cost, TRIAC based, leading edge phase dimmers introduced a number of trade-offs in the design.

Due to the much lower power consumed by LED based lighting, the current drawn by the overall lamp is below the holding current of the TRIAC within many dimmers. This causes undesirable behavior such as limited dim range and/or flickering when the TRIAC fires inconsistently. The relatively large impedance presented to the line by the LED driver allows significant ringing to occur due to the inrush current charging the input capacitance when the TRIAC turns on. This effect can cause similar undesirable behavior, as the ringing may cause the TRIAC current to fall to zero and turn off.

To overcome these issues, the Passive Damper and Passive Bleeder were incorporated. The drawback of these circuits is increased dissipation and therefore reduced efficiency of the supply. For non-dimming application these components can simply be omitted.

The Passive Damper consists of components R13 and R9 to limit inrush currents and associated ringing of the input impedance during TRIAC dimming.

The Passive Bleeder circuit is comprised of C8, C9 and parallel combination of R1, R2, and R3. This keeps the input current above the TRIAC holding current while the input current corresponding to the driver increases during each AC half-cycle preventing the TRIAC from oscillating on and off at the start of each conduction angle period.

This arrangement provided flicker-free dimming operation with phase angle dimmers tested including units from Europe, China, Korea. See Section 9 for details.

7.5 Inductor Construction

Bobbin Preparation	Place the bobbin item [2] on the mandrel such that pin side on the left side. Winding direction is the clockwise direction.
WDG 1	Starting at pin 6, wind 48 turns of wire item [4] in three layers. Apply one layer of tape item [3] per layer. Finish at pin 2.
Final Assembly	Grind core to achieve 0.36 mH inductance.

8 Performance Data

All measurements performed at room temperature using an LED load. The following data were measured using 3 sets of loads to represent the load range of 33 V ~ 39 V output voltage). Refer to the table on Section 8.6 for the complete set of test data values.

8.1 Efficiency

Figure 10 – Efficiency vs. Line and Load.

8.2 Line and Load Regulation

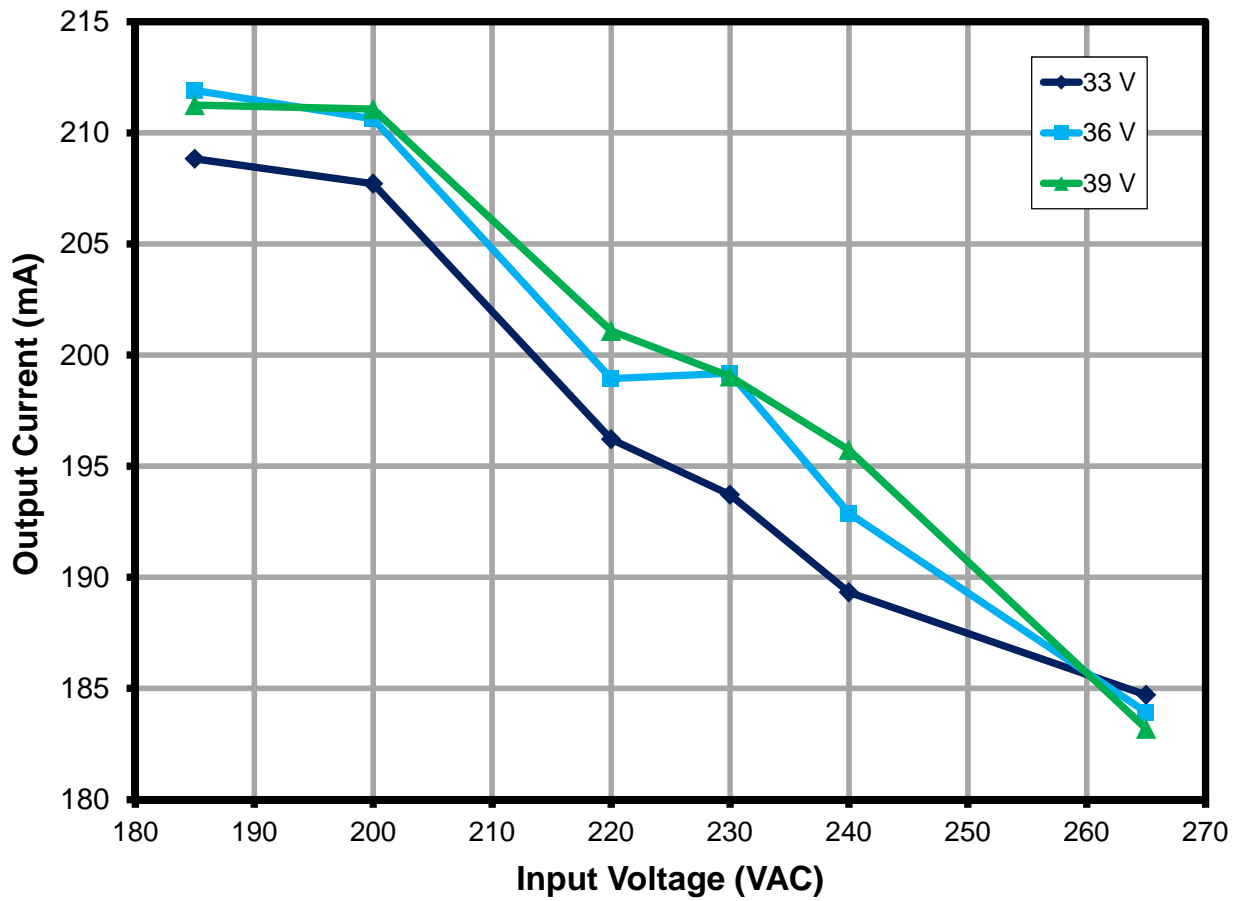

Figure 11 – Regulation vs. Line and Load.

8.3 Power Factor

Figure 12 – Power Factor vs. Line and Load.

8.4 A-THD

Figure 13 – A-THD vs. Line and Load.

8.5 Harmonics

The design met the limits for Class C equipment for an active input power of <25 W. In this case IEC61000-3-2 specifies that harmonic currents shall not exceed the limits of Class D equipment¹. Therefore the limits shown in the charts below are Class D limits which must not be exceeded to meet Class C compliance.

8.5.1 33 V LED Load

9 Dimming Performance Data

TRIAC Dimming Results were taken with input voltage of 230 VAC, 50 Hz line frequency, room temperature, and nominal 36 V LED load.

9.1 Performance with Dimmers from China

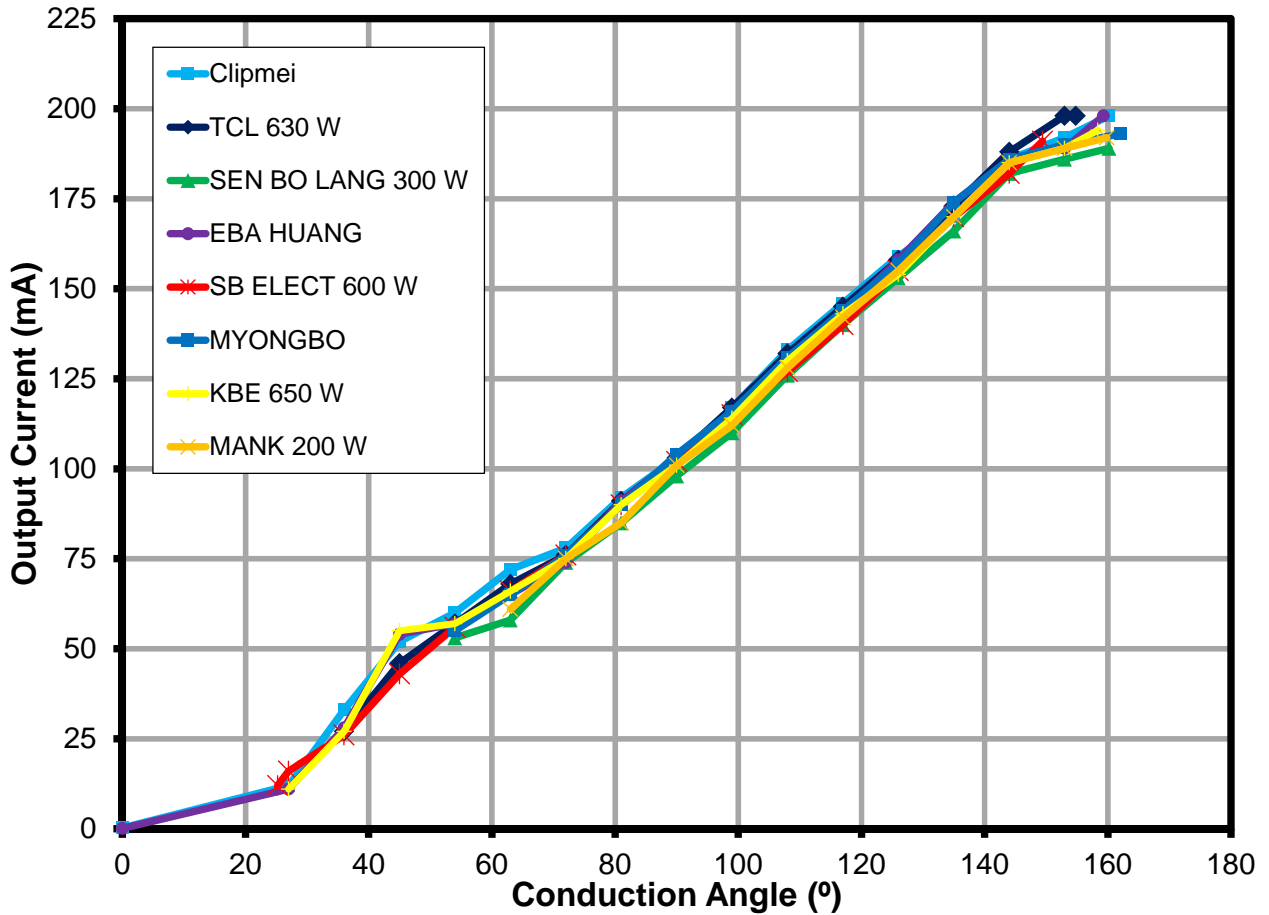

Figure 17 – China Dimmers Dimming Curve.

Dimmer	Minimum Conduction Angle, °	Minimum I _{OUT} , mA	Maximum Conduction Angle, °	Maximum I _{OUT} , mA
CLIPMEI	27	12	160	198
TCL 630 W	27	12	155	198
SEN BO LANG 300 W	43	31	160	189
EBA HUANG	27	11	160	198
SB ELECT 600 W	25	12	150	191
MYONGBO	38	37	162	193
KBE 650 W	27	11	158	194
MANK 200 W	50	52	160	192

Figure 18 – China Dimmers Minimum and Maximum Dimming Characteristic.

9.2 Performance with Dimmers from Germany

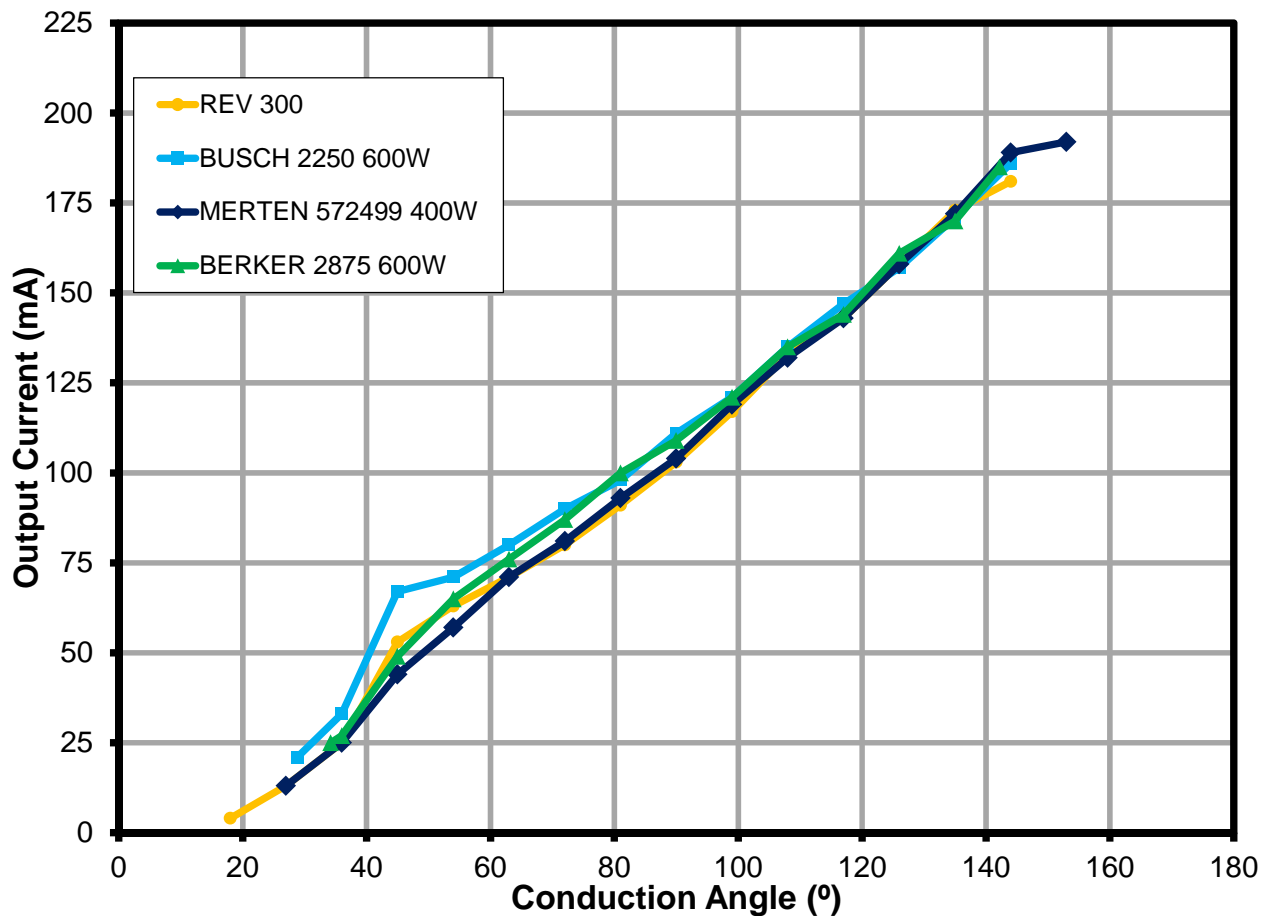

Figure 19 – German Dimmers Dimming Curve.

Dimmer	Minimum Conduction Angle, °	Minimum I _{OUT} , mA	Maximum Conduction Angle, °	Maximum I _{OUT} , mA
REV 300 W	18	4	144	181
BUSCH 600 W	28.8	21	144	186
MERTEN 400 W	27	13	153	192
BERKER 600 W	34	25	142	185

Figure 20 – German Dimmers Minimum and Maximum Dimming Characteristics.

9.3 Performance with Dimmers from Korea

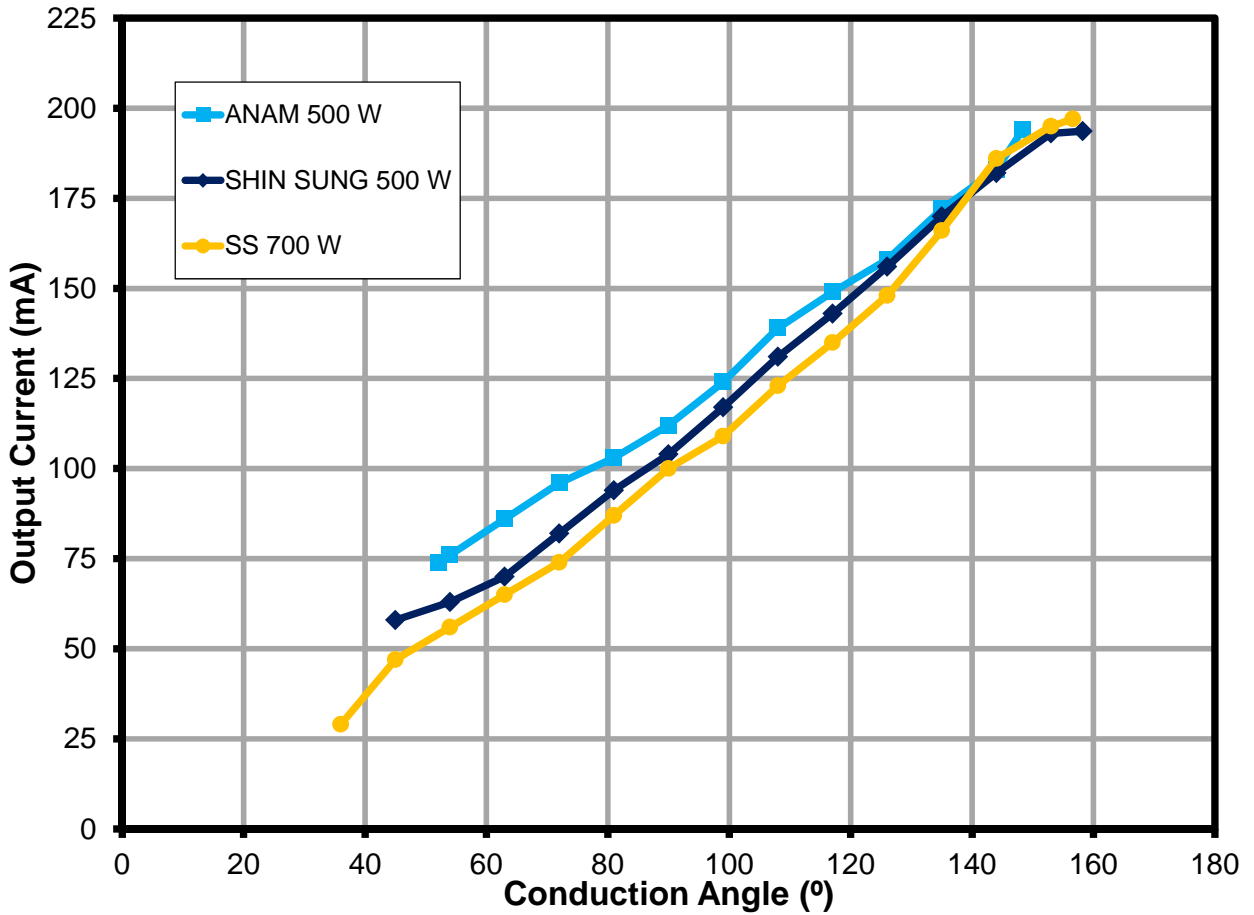

Figure 21 – Korean Dimmers Dimming Curve.

Dimmer	Minimum Conduction Angle, °	Minimum I _{OUT} , mA	Maximum Conduction Angle, °	Maximum I _{OUT} , mA
ANAM 500 W	52.2	74	148	194
SHIN SUNG 500 W	45	58	158	194
SS 700 W	36	29	156	197

13 Conducted EMI

13.1 Test Set-up

The unit was tested using LED load ($\sim 36\text{ V } V_{\text{OUT}}$) with input voltage of 230 VAC, 60 Hz at room temperature.

Figure 81 – EMI Test Set-up with the Unit and LED Load Placed Inside the Cone.

Figure 82 – Conducted EMI, 36 V LED Load, 230 VAC, 60 Hz, and EN55015 B Limits.

14 Line Surge

The unit was subjected to ± 2500 V 100 kHz ring wave and ± 500 V differential surge at 230 VAC using 10 strikes at each condition. A test failure was defined as a non-recoverable interruption of output requiring supply repair or recycling of input voltage.

Level (V)	Input Voltage (VAC)	Injection Location	Injection Phase (°)	Type	Test Result (Pass/Fail)
+2500	230	L1, L2	0	100kHz Ring Wave (200 A)	Pass
-2500	230	L1, L2	0	100kHz Ring Wave (200 A)	Pass
+2500	230	L1, L2	90	100kHz Ring Wave (200 A)	Pass
-2500	230	L1, L2	90	100kHz Ring Wave (200 A)	Pass

Level (V)	Input Voltage (VAC)	Injection Location	Injection Phase (°)	Type	Test Result (Pass/Fail)
+500	230	L1, L2	0	Surge (2Ω)	Pass
-500	230	L1, L2	0	Surge (2Ω)	Pass
+500	230	L1, L2	90	Surge (2Ω)	Pass
-500	230	L1, L2	90	Surge (2Ω)	Pass

Figure 83 – 1 kV (90° Injection Phase) Differential Surge VDS Waveforms.

M1: U1 VDS maximum voltage of <600 V.

C1: U1 Drain Voltage Reference to Output Return.

C2: U1 Source Voltage Reference to Output Return.

Design Note: For 1 kV differential surge withstand, due to higher energy vs. 500 V, damper resistors R9 and R13 could potentially open after several strikes. An alternative configuration can be implemented to prevent this. The MOV should be placed before the passive damper resistors R9 and R13 and a safety fuse should be added on the line terminal to protect against failure of the MOV.
