

Design Example Report

Title	High Efficiency (>90%), Power Factor Corrected, 7.2 W Output LED Driver Using LinkSwitch™-PL LNK460VG
Specification	185 VAC – 265 VAC Input; 36 V _{TYP} , 200 mA Output
Application	A19 LED Driver
Author	Application Engineering Department
Document Number	DER-303
Date	January 11, 2012
Revision	1.0

Summary and Features

- Single-stage power factor correction combined with constant current (CC) output
- Highly energy efficient, >90%
- Low cost, low component count, small size and single-sided PCB
- Integrated protection, reliability and lifetime features
 - Single shot no-load protection / output short-circuit protected with auto-recovery
 - Auto-recovering thermal shutdown with large hysteresis protects both components and PCB
 - No damage during brown-out conditions
 - No aluminum electrolytic bulk capacitor
- PF >0.9 at 230 VAC, EN6000-3-2 Class D compliant
- % ATHD <20% at 230 VAC; 36 V LED
- Meets IEC ring wave, differential line surge and EN55015 conducted EMI
- Protected in case of open-circuit load
- For TRIAC dimmable version see DER-302

PATENT INFORMATION

The products and applications illustrated herein (including transformer construction and circuits external to the products) may be covered by one or more U.S. and foreign patents, or potentially by pending U.S. and foreign patent applications assigned to Power Integrations. A complete list of Power Integrations' patents may be found at www.powerint.com. Power Integrations grants its customers a license under certain patent rights as set forth at <<http://www.powerint.com/ip.htm>>.

Important Note: Although this board is designed to satisfy safety isolation requirements, the engineering prototype has not been agency approved. Therefore, all testing should be performed using an isolation transformer to provide the AC input to the prototype board.

1 Introduction

The document describes a non-isolated, high efficiency, high power factor (PF) LED driver designed to drive a nominal LED string voltage of 36 V at 200 mA from an input voltage range of 185 VAC to 265 VAC (47 Hz – 63 Hz). The LED driver utilizes the LNK460VG from the LinkSwitch-PL family of ICs.

The topology used is a single-stage non-isolated buck that meets the stringent space and efficiency requirements for this design. LinkSwitch-PL based designs provide a high power factor (>0.9) meeting international requirements.

This design was not optimized for operation with phase dimmers. If this is a requirement, please see DER-302.

This document contains the LED driver specification, schematic, PCB details, bill of materials, transformer documentation and typical performance characteristics.

2 Power Supply Specification

The table below represents the minimum acceptable performance of the design. Actual performance is listed in the results section.

Description	Symbol	Min	Typ	Max	Units	Comment
Input Voltage Frequency	V_{IN} f_{LINE}	185	230 50	265	VAC Hz	2 Wire – no P.E.
Output Output Voltage Output Current	V_{OUT} I_{OUT}		36 200		V mA	$V_{OUT} = 36$ V, $V_{IN} = 230$ VAC, 25 °C
Total Output Power Continuous Output Power	P_{OUT}		7.2		W	
Efficiency Full Load	η	90			%	Measured at P_{OUT} 25 °C
Environmental Conducted EMI Safety			CISPR 15B / EN55015B Non-Isolated			
Ring Wave (100 kHz) Differential Mode (L1-L2)			2.5		kV	
Differential Surge			500		V	1 kV with minor changes. See Section 12.
Power Factor		0.9				Measured at $V_{OUT(TYP)}$, $I_{OUT(TYP)}$ and 230 VAC, 50 Hz
Harmonic Currents			EN 61000-3-2 Class D (C)			Class C specifies Class D Limits when $P_{IN} < 25$ W
Ambient Temperature	T_{AMB}		50		°C	Free convection, sea level

4 Circuit Description

The LinkSwitch-PL (U1) is a highly integrated primary-side controller intended for use in LED driver applications. The LinkSwitch-PL provides high power factor while regulating the output current across a range of input (185 VAC to 265 VAC) in a single conversion stage. The design also supports the output voltage variations typically encountered in LED driver applications. All of the control circuitry responsible for these functions plus the high-voltage power MOSFET is incorporated into the IC.

4.1 Input EMI Filtering

Inductors L1-L3 and C1-C2 filter the input switching current presented by the buck converter to the line. Resistor R1, R2 and R3 across L1, L2 and L3 damp any resonances between the input inductors, capacitors and the AC line impedance which would otherwise cause peaks in conducted EMI measurements.

MOV RV1 provides a clamp to limit the maximum voltage during differential line surge events. Zener diode VR2 was added to increase immunity to differential line surge. Bridge rectifier BR1 rectifies the AC line voltage with capacitor C2 providing a low impedance path (decoupling) for the switching current. A low value of capacitance (sum of C1 and C2) is necessary to maintain a power factor of greater than 0.9.

4.2 Power Circuit

The circuit is configured as a buck converter with the pin of U1 connected on top of the freewheeling diodes D2 and D4 and DRAIN (D) pin connected to the positive side of the DC rectified input thru D1. Diode D1 is used to prevent reverse current from flowing through U1. An RM6 core size was selected to optimize the inductor for highest system efficiency. Capacitor C7 is selected to give an output current ripple of <±50%.

Capacitor C5 provides local decoupling for the BYPASS (BP) pin of U1 which is the supply pin for the internal controller. During start-up, C5 is charged to ~6 V from an internal high-voltage current source connected to the DRAIN pin. At this point U1 starts switching and the operating supply current is also provided from inductor T1 via R8, D5 and D6.

The series combination of D5 and D6 was used to provide very fast recovery and low capacitance. This was required minimize the current pulled out of the FB pin when charging the reverse capacitance of D5 and D6 when U1 power MOSFET is conducting. A single ultrafast diode (UF4005) may be used with the result of slightly poorer output regulation.

4.3 Output Feedback

Resistor R4 and R5 are used to sense the diode current of the buck converter. Its value is adjusted to center the output current at 200 mA at nominal input voltage. Capacitor C4 is used to filter the high frequency component of the diode current which helps improve

overall efficiency. Resistor R6 and C6 provide additional filtering to lower the ripple voltage feed to the FEEDBACK (FB) pin of U1 for improved regulation.

4.4 Open Load Protection

The LED driver is protected in the event of accidental open load operation by monitoring the voltage across the output inductor during energy decay (current flowing in D2 and D4). Zener diode VR1 sets the OVP threshold which forces U1 to enter cycle-skipping mode.

During open load condition, the output capacitor can be charged to a voltage that exceeds the threshold of VR1 because of the leakage current that flows to the output capacitor even when U1 is off. Resistor R7 is used limit the maximum output voltage by partially discharging the output during open load, but with the tradeoff on efficiency during normal operation. This resistor also ensures the LED load quickly turns off when AC is removed.

For designs which require absolute OVP protection for the output capacitor, a Zener diode with Zener voltage greater than or equal to VR1 Zener voltage can be added across the output.

7 Inductor Specification

7.1 Electrical Diagram

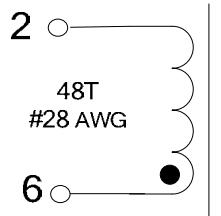

Figure 8 – Inductor Electrical Diagram.

7.2 Electrical Specifications

Primary Inductance	Pins 2-6, all other windings open, measured at 100 kHz, 0.4 V _{RMS}	360 μ H \pm 7%
Resonant Frequency	Pins 2-6, all other windings open	2 MHz (Min.)

7.3 Materials

Item	Description
[1]	Core: TDKPC95RM06-Z.
[2]	Bobbin: B-RM6-V-6pins-(3/3) with mounting clip, CLIP-RM6.
[3]	Tape, Polyester film, 3M 1350F-1 or equivalent, 6.4 mm wide.
[4]	Wire: Magnet, #28 AWG, solderable double coated.

7.4 Inductor Build Diagram

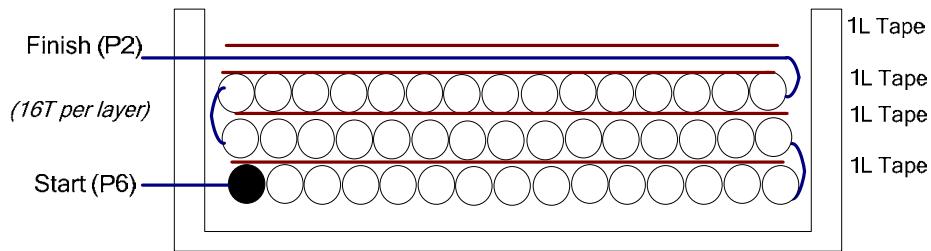

Figure 9 – Inductor Build Diagram.

7.5 Inductor Construction

Bobbin Preparation	Place the bobbin item [2] on the mandrel such that pin side on the left side. Winding direction is the clockwise direction.
WDG 1	Starting at pin 6, wind 48 turns of wire item [4] in three layers. Apply one layer of tape item [3] per layer. Finish at pin 2.
Final Assembly	Grind core to get 0.36 mH inductance.

8 Performance Data

All measurements performed at room temperature using an LED load. The following data were measured using 3 sets of loads to represent the load range of 33 V ~ 39 V output voltage). Refer to the table on Section 8.6 for the complete set of test data values.

8.1 Efficiency

8.4 A-THD

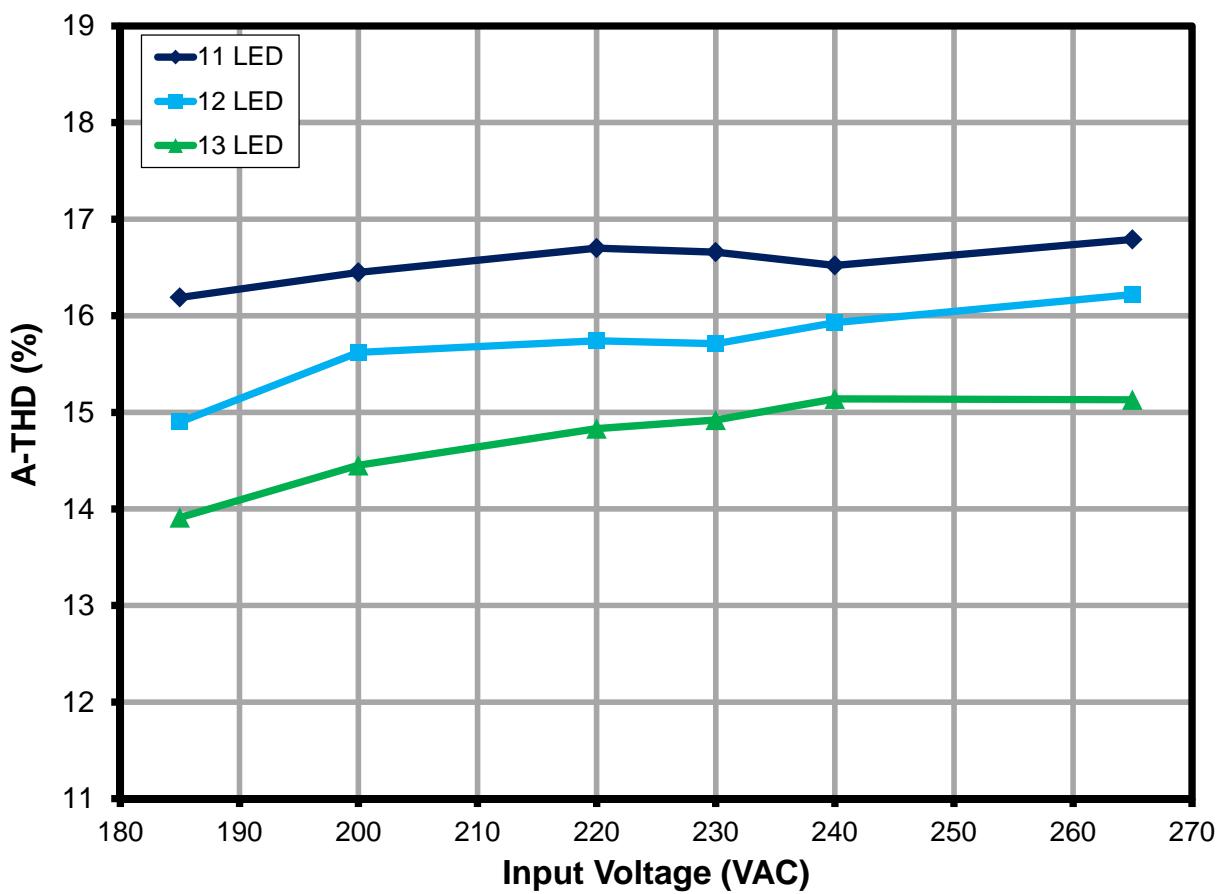

Figure 13 – A-THD vs. Line and Load.

8.5 Harmonics

The design met the limits for Class C equipment for an active input power of <25 W. In this case IEC61000-3-2 specifies that harmonic currents shall not exceed the limits of Class D equipment¹. Therefore the limits shown in the charts below are Class D limits which must not be exceeded to meet Class C compliance.

11 Conducted EMI

11.1 Test Set-up

The unit was tested using LED load (~ 36 V V_{OUT}) with input voltage of 230 VAC, 60 Hz at room temperature.

Figure 53 – EMI Test Set-up With the Unit and LED Load Placed Inside the Cone.

Power Integrations, Inc.

11.2 EMI Test Result

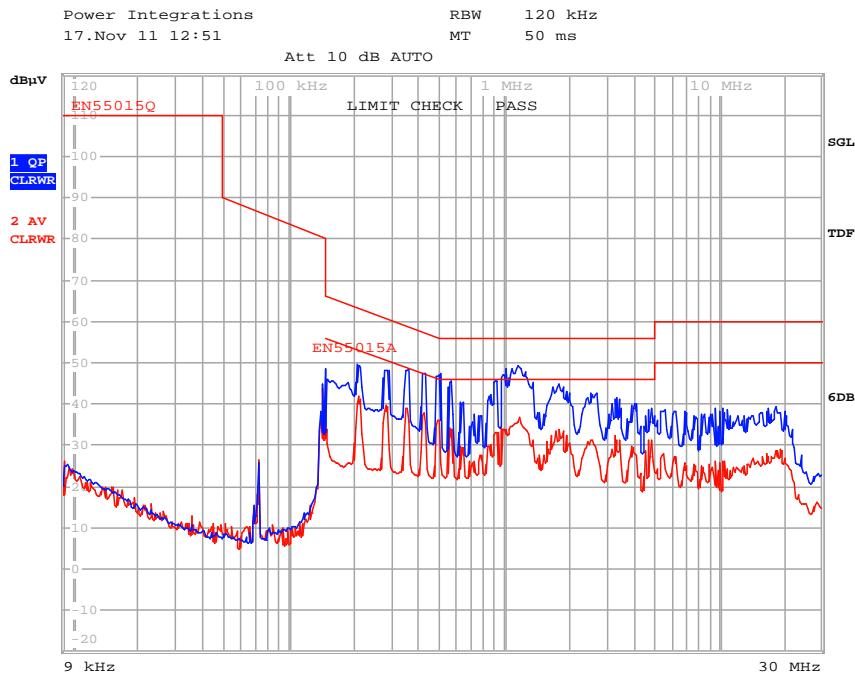

Figure 54 – Conducted EMI, L1 Phase. 36 V / 200 mA Load, 230 VAC, 60 Hz, and EN55015 Limits.

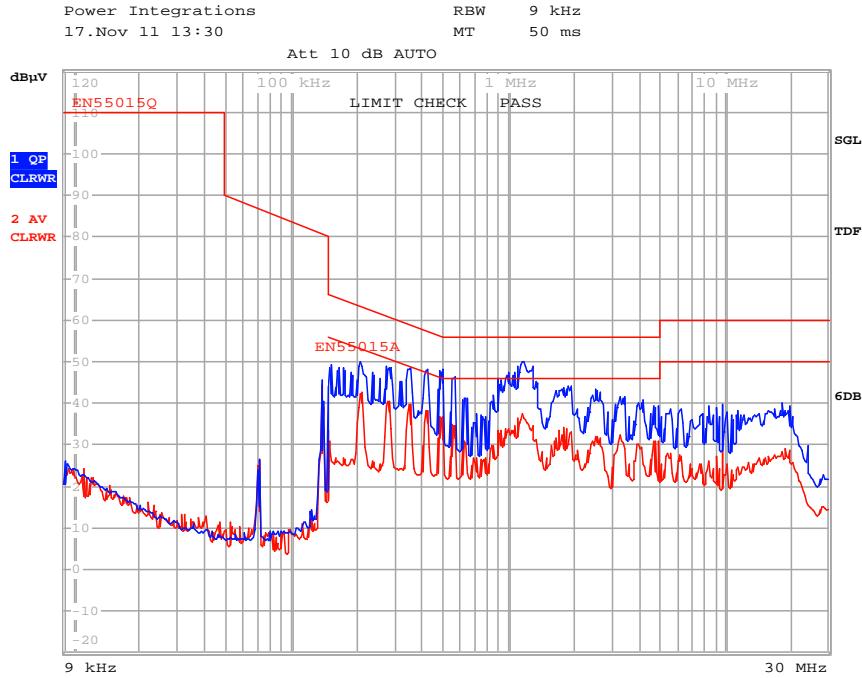

Figure 55 – Conducted EMI, NTL Phase. 36 V / 200 mA Load, 230 VAC, 60 Hz, and EN55015 Limits.

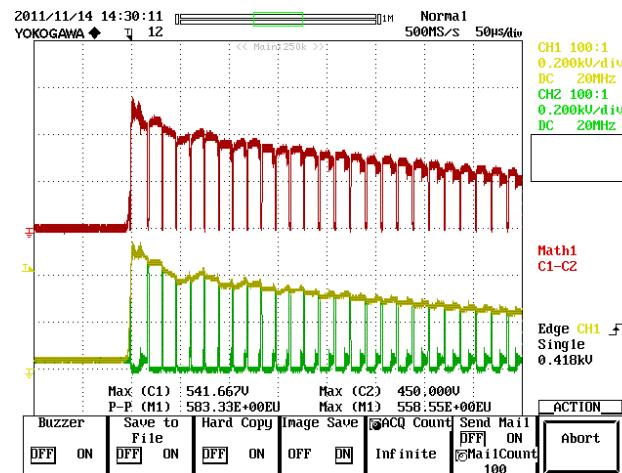

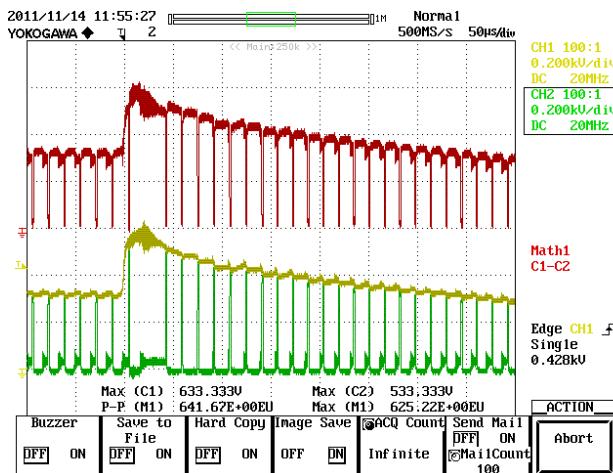

12 Line Surge

12.1 Line Surge Waveform

The power supply was tested for differential 500 V 1.2 / 50 μ s surge and for differential 2.5 kV ringing waveform.

12.1.1 500 V 1.2 / 50 μ s Surge Test Drain Waveforms Worst Case

In the above right-side picture, the surge is injected at zero-degrees phase. Before the surge, the bulk cap is uncharged and the controller is not switching. When the surge is injected the bulk cap gets charged and the controller starts to run.

12.1.2 Increasing Differential Sure Withstand to 1 kV

For 1 kV differential surge withstand, due to higher energy vs. 500 V, damper resistors R9 and R13 could potentially open after several strikes. An alternative configuration can be implemented to prevent this. The MOV should be placed before the passive damper resistors R9 and R13 and a safety fuse should be added on the line terminal to protect against failure of the MOV.

Power Integrations, Inc.

Tel: +1 408 414 9200 Fax: +1 408 414 9201
www.powerint.com

12.2 Line Surge Summary

Input voltage was set at 230 VAC / 60 Hz. Output was loaded with 36 V LED string and operation was verified following each surge event.

Differential input line 1.2 / 50 μ s surge testing was completed on one test unit to IEC61000-4-5.

Surge Level (V) 10 strikes / condition	Input Voltage (VAC)	Injection Location	Injection Phase ($^{\circ}$)	Test Result (Pass/Fail)
+500	230	L to N	0	Pass
-500	230	L to N	0	Pass
+500	230	L to N	90	Pass
-500	230	L to N	90	Pass

Differential input line ring surge testing was completed on one test unit to IEC61000-4-5.

Surge Level (V) 10 strikes / condition	Input Voltage (VAC)	Injection Location	Injection Phase ($^{\circ}$)	Test Result (Pass/Fail)
+2500	230	L to N	0	Pass
-2500	230	L to N	0	Pass
+2500	230	L to N	90	Pass
-2500	230	L to N	90	Pass

Unit passes under all test conditions.
